$$\mathcal{F}_{\mathtt{orset}}(\mathtt{rd}, E, \mathtt{op}, \mathtt{vis}, \mathtt{ar}) = \{ a \mid \exists e \in E.\mathtt{op}(e) = \mathtt{add}(a) \}$$
 (1)

$$\wedge \left(\forall f \in E.\mathsf{op}(f) = \mathsf{rm}(a) \implies \neg (e \xrightarrow{\mathsf{vis}} f) \right) \}. \tag{2}$$

Replicated Data Types with Composite Operations

3.1 Specification

32

We consider a composite operation of a replicated data type τ in the form of $C = A \oplus B$, where A, B, and C are different objects of type τ .

Following [1], we specify the semantics of a composite operation $A \oplus B$ of a replicated data type τ by a function \mathcal{F}_{τ} that determines the return value of \oplus based on prior operations performed on the two objects involved (i.e., A and B). However, \mathcal{F}_{τ} for a composite operation \oplus takes as parameters two, not one as in [1], operation contexts, one on each object involved.

Q: Generalize to different data types?

Note: Partial operation context [2]

XX:2 Specification, Implementation, and Complexity of Replicated Data Types with Composite Operations

Definition 1 (Product of Operation Contexts). Consider two operation contexts for the same replicated data type τ :

$$\mathcal{C}_A = (E_A, \mathsf{op}_A, \mathsf{vis}_A, \mathsf{ar}_A) \tag{3}$$

$$\mathcal{C}_B = (E_B, \mathsf{op}_B, \mathsf{vis}_B, \mathsf{ar}_B) \tag{4}$$

The product $C = C_A \times C_B$ of C_A and C_B is also an operation context defined as $C = (E, \mathsf{op}, \mathsf{vis}, \mathsf{ar})$, where

 $E = E_A \times E_B$

 $_{ ext{42}}$ lacksquare $\operatorname{\mathsf{op}} = \operatorname{\mathsf{op}}_A \sqcup \operatorname{\mathsf{op}}_B$

 $_{43}$ $_{\blacksquare}$ $vis = vis_A \times vis_B$

 $ar = ar_A \times ar_B$

▶ Definition 2.

$$\mathcal{F}_{\tau}(\oplus, \mathcal{C}_A, \mathcal{C}_B) = \mathcal{F}_{\tau}(\oplus, \mathcal{C}_A \times \mathcal{C}_B) \tag{5}$$

4 Replicated Set with Composite Operations

- We consider the replicated set data type with composite operations including union (\cup) , intersection (\cap) , and set difference (\setminus) .
- 50 4.1 Specification

$$\mathcal{F}_{\mathtt{orset}}(A \setminus B, \mathcal{C}_A, \mathcal{C}_B) \tag{6}$$

$$= \{a \mid \exists (e, e') \in E_A \times E_B. \Big((\operatorname{op}(e) = \operatorname{add}(a) \wedge \operatorname{op}(e') = \operatorname{rm}(a) \Big)$$
 (7)

$$\land \, \forall (f,f') \in E_A \times E_B. \big((\operatorname{op}(f) = \operatorname{add}(a) \land \operatorname{op}(f') = \operatorname{add}(a)) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{add}(a) \big) \lor (\operatorname{op}(f) = \operatorname{rm}(a) \land \operatorname{op}(f') = \operatorname{rm}(a) \land \operatorname{op$$

$$\implies \neg \left((e, e') \xrightarrow{\mathsf{vis}} (f, f') \right) \right) \}. \tag{9}$$
